

Emerging Market Debt: Indexing on the Rise

SPDR EMEA Strategy & Research

Emerging market debt (EMD) remains one of the most rapidly evolving asset classes in investment markets. New developments are challenging some of the traditional perceptions around how to access it.

In the past, adopting an active management approach was perceived as the best way to invest in EMD based on the following assumptions:

- An indexed exposure is too expensive to be implemented effectively in emerging markets.
- EMD is an inefficient market and detailed fundamental knowledge should enable active managers to identify and extract value.
- There are some obvious 'weak' segments of the universe that could drag performance down; active managers can avoid these, an option not open to investors applying an index approach.

The reality is very different, however. EMD now offers much greater liquidity and diversity, while the majority of active managers fail to outperform their benchmarks over the longer term. In this paper, we illustrate how the EMD universe has evolved and why an indexed approach is becoming accepted as a practical solution for this more complex exposure.

A Large, Diverse and Liquid Universe

The EMD universe has grown dramatically over the past decade, with the expansion of local currency markets acting as a primary catalyst. Most recently, index providers have started to add China to their indices. Bloomberg Barclays commenced this process in April 2019 at a pace of 0.5% per month while JP Morgan will start by adding 1% per month from March onwards.

Importantly, not only has the EMD market grown in size, but the types of securities on offer have become much more diverse. For example, we have seen the emergence of local inflation-linked bonds, as well as hard currency and local currency corporate bonds. And while the local currency corporate bond universe is still a market reserved primarily for local investors, hard currency EM corporate bonds have gained increasing popularity with international investors.

Our analysis focuses on the investible universe based on the indices most followed by institutional investors in hard currency sovereign and corporate debt and in local currency nominal and inflation-linked debt. Based on our estimates, this universe stood at \$5.5 trillion at the end of December 2019 (Figure 1). To put this in context, this is more than twice the size of the global high yield market, which is often seen as a more traditional growth asset for fixed income investors.

While the increase in market size has been well documented, the fact that EMD liquidity is now on a par with investment grade (IG) credit is less widely known. The Bloomberg LQA (Liquidity Assessment) for a selection of indices is shown in Figure 2. A score of 100 represents the most liquid basket of securities and demonstrates that trading in EM hard currency is as close to liquid as IG corporate bonds. Local currency issues are even more liquid. Both local and hard currency securities are more liquid than high yield bonds. At State Street Global Advisors, our experience of investing in and managing indexed EMD exposures for 14 years echoes these results from Bloomberg.

Active vs. Index in EMD

The evolution of the EM fixed income universe has created opportunities that more and more investors are starting to appreciate and embrace. While active managers have struggled to consistently deliver excess returns, indexed strategies have evolved and developed sophisticated techniques capable of delivering the return of the benchmark in a cost-efficient manner.

We have carried out a comprehensive study of the active managers in the Morningstar database tracking two flagship EMD indices: JPM GBI-EM Global Diversified Index (GBI-EM) for local currency and JPM EMBI Global Diversified Index (EMBI) for hard currency. As illustrated in Figure 3, in both local and hard currency debt, while some active managers outperform their benchmarks, the majority have failed to do so over the longer term.

Figure 3
Percentage of Active Managers Who Fail to Outperform Benchmarks

	1 Year (%)	3 Years (%)	5 Years (%)
Local Currency Universe	73	87	83
Hard Currency Universe	67	80	82

Source: Morningstar. The universe is generated by selecting the 30 largest live funds as of 31 December 2019.

Outperforming the benchmark seems to be particularly challenging for active managers in the local currency universe. In 2019, just 27% of the funds in our universe managed to outperform the GBI-EM (Figure 4a). This was broadly in line with the five-year average but the percentage of outperforming funds has been as low as 7% (2018) and only as high as 43% (2017). This shows us that underperformance is not the result of a single bad year or a one-off 'black swan' event but rather a consistent and persistent problem.

Active managers in the hard currency sovereign universe have also struggled to outperform consistently as a group. The strong performance seen in 2016 (53% of managers outperformed) and 2017 (60%) were book ended by some very poor performances (Figure 4b). In 2019, around a third of managers outperformed, which is in line with the five-year average. These results raise questions about the ability of a typical active manager to outperform over the market cycle.

There is some semblance of a correlation between market underperformance and active manager underperformance. In the local currency universe, strong market returns in 2016 and 2017 saw an above average number of funds outperform the index, while negative returns in 2018 resulted in 93% of managers underperforming.

In the hard currency universe, which is less volatile, active managers have typically done better. However, even here the underperformance rate in 2018 of 93% matched that of the local currency managers. Moreover, strong market gains in 2019 saw decidedly average outperformance rates for both local and hard currency managers. So strong market performance alone is not a guarantee of active manager success or sufficient downside protection.

Downside Protection

In our discussions with investors about EMD, it seems that, conceptually, they like the protection that a bottom-up, fundamentally driven active approach should provide. After all, why should investors buy every issuer and country when some of them are unattractive from a fundamental risk/return profile? Unfortunately, our research does not support the idea that such approaches provide meaningful downside protection.

This is the case even in the hard currency universe, where the diversified profile and absence of currency effects should create optimal conditions for active approaches to mitigate downside risk. We looked at seven instances of significant negative return events in recent years driven by individual or multiple countries.

In general, they were the result of a number of factors, including a sharply deteriorating economic outlook, political instability and debt restructuring. Some were perhaps easier to foresee (Venezuela, Ukraine) while others were more unexpected (Russia, Brazil). In any event, either active managers were unable to predict these developments effectively or behavioural biases affected their ability to manage these events profitably. As Figure 5 illustrates, even the top 20 managers were unable to outperform the index during these country-driven events.

Figure 5

Why Active Managers Struggle to Outperform

The inherently ‘high-octane’ and volatile nature of the EMD sector is likely one of the key causes of active manager underperformance. Returns are often misaligned with fundamentals, as they are driven by investor sentiment and political risk, which are harder to predict and often lead to binary outcomes. More specifically, active managers face different challenges in hard and local currency debt.

In hard currency debt, performance is often driven by high yield names in the index, as the investment grade names are already fairly priced and provide fewer opportunities for alpha generation. Importantly, within this high yield sub-index, it is often distressed names that determine whether a manager underperforms or outperforms the index. For example, in recent years, making the right calls on situations such as Argentina’s litigation with holdout creditors, Ukraine’s restructuring or Venezuela’s willingness and ability to meet its debt obligations have been key to active manager performance. While many of these countries are only a small part of the index, being under or overweight them makes a big difference to performance, due to their high yield and the volatility of their returns.

By definition, these names are fundamentally weak and, if a manager is driven by a quality-focused, bottom-up approach, they may miss the potential for sudden revivals. For instance, Venezuela has been thought of as a “basket case” for years, amid an ever worsening political and economic backdrop, but only announced a debt restructuring at the end of 2017. The year before that it actually delivered a staggering return of 53%.

Had investors been consistently driven by fundamentals and been underweight the country, they would have incurred a significant cost of carry. Although the country’s average index weight was only 1.74% in the three years to 1 June 2018, its average yield was 32.2%. While many would have foreseen that a restructuring was on the cards for the troubled LatAm nation, getting the timing right would have been the main challenge. The many binary decisions active managers must take in the hard currency space may partly explain why they consistently struggle to outperform.

In local currency debt, the performance drivers are different: foreign exchange (FX) matters in the short term and local rates in the long term. EM currencies are typically the main adjustment valve to reflect market sentiment, which means that making the right call, especially in times of heightened market volatility, is particularly difficult.

Active managers must make a call between being underweight the currency of weaker but higher yielding countries, thereby incurring a significant cost of carry, or being overweight and facing the consequences if fortunes reverse. For instance, in 2019 strong coupon and price returns on Turkish debt more than outweighed the depreciation of the lira, resulting in a respectable 2.5% return over the year. Conversely, some very high returns on Argentina bonds were insufficient to outweigh the currency effect, with returns on the year down 3.5%. Contrary to what one might expect, being able to adjust to the rapidly changing macro backdrop has been hard for active managers.

Another potential explanation of active manager underperformance in both local and hard currency debt is that they may get stuck in value traps. For example, there is often more value in smaller issuers than bigger ones, partly due to the illiquidity premium of the former. Active managers target these pockets of illiquidity to generate alpha as they tend to produce stellar returns in a rallying market. However, the opposite is true during sell-offs and managers may find themselves inadvertently locked in when liquidity dries up. This is another potential explanation of why the drawdowns for active managers are typically much higher than the index during sell-offs.

Diversification as a Bulwark

The nature of EM sell-offs is often event and sentiment driven, which makes them difficult to predict. Furthermore, restructuring cases, such as Ukraine and more recently Venezuela, can drag on for extended periods, providing significant carry along the way. A high degree of uncertainty, combined with quite binary outcomes, means that active managers have to gamble on whether to be under or overweight, which may or may not pay off.

Being neutral to the index is also an option, but that is not what managers are paid to do. On the other hand, history shows that diversification can help mitigate potential credit events and a credit risk premium can be harvested across the overall diversified exposure to compensate for such events. Having broad index exposure appears to offer investors protection from some of the inherent behavioural biases of active managers and can provide higher return potential, despite offering exposure to both stronger and weaker parts of the universe.

An example that illustrates the importance of diversification is Nigeria and its removal from the GBI-EM Index in late 2015. After the announcement was made, Nigeria defied all conventional wisdom and staged a strong rally before its actual exit date. This may have caught out many active investors who would typically have seen this as a signal to sell. If they liquidated their exposure before the actual removal of the country from the index, they would have incurred losses versus the index due to their underweight position. An index manager, however, is bound to replicate the country exposure of the index and would have benefitted from this situation.

Index Strategies Can Provide Cost-Effective Solutions

In the past, the high cost of replication, market volatility and inefficiency have been seen as the main obstacles to the use of index strategies in the EMD space. Although these concerns appear valid, indexing techniques have moved a long way from simply buying all the names in the index; there are practical steps that experienced investment managers can take to seek to minimise these negative effects. At State Street, we have been running indexed EMD strategies for 14 years and now have over \$27 billion in assets under management across local currency and hard currency debt, sovereigns and corporates. This investment expertise is evident in our consistent and efficient delivery of benchmark returns in indexed EMD strategies and funds.

These days, the cost of replication is no longer as prohibitive as many might expect. As we demonstrated in Figure 2, the trading cost for EM hard currency bonds is now comparable to investment grade corporate bonds, and the cost for local currency denominated securities is even lower. When you marry this with an experienced, dedicated and co-located EMD trading desk, portfolio managers (PMs) are able to keep replication costs down.

Index turnover directly affects returns via rebalancing costs, and EMD indices typically experience higher levels of turnover than other fixed income benchmarks. Experienced and dedicated PMs are able to minimise turnover by proactively anticipating index changes, gaining exposure through primary market placements and working with their traders to access liquidity pools, with both well-known investment banks and local brokers.

Examples of this include using the primary market to access illiquid markets prior to their inclusion in the index, managing this risk through the forward or non-deliverable forward market and ultimately delivering benchmark returns through a thoughtful but risk-controlled investment process. Managers like State Street are also able to capture structural risk premia that arise in the EMD market to offset costs.

Another feature of the space is that certain taxes are difficult to avoid when holding local EM bonds. However, a sophisticated investment management process that understands the risk/reward trade-offs between fully replicating the benchmark and alternative positions or proxies can minimise the tax drag without compromising on acceptable levels of risk. At State Street, we work with both the client and their custodians to get the most favourable tax status and to create strategies that reduce the tax impact.

Finally, indexed EMD strategies are not passive when it comes to portfolio construction and security selection. Experienced portfolio managers will consider market dynamics, liquidity and other factors when choosing securities in order to gain the required underlying exposure in the most effective and performance-enhancing way.

Summary

Over the last 15 years, the EMD sector has been transformed in terms of market size, liquidity and security type. The majority of active managers have persistently struggled with the volatile and changeable nature of EMD and have largely failed to provide either excess returns or downside protection.

More cost-efficient and transparent index approaches are now being seen as highly effective and are gaining popularity among institutional investors. In the future, as emerging economies evolve further, EM bond exposures may become a core part of investors' fixed income portfolios. However, decisions as to what exposure to take and via which investing style will be paramount in determining whether the full potential benefits are realised.

Glossary

JP Morgan EMBIG Tracks dollar-denominated sovereign bonds issued by a selection of emerging market countries. The index limits the weights of countries with larger debt stocks by only including a specified portion of these countries' eligible current face amounts of debt outstanding.

About State Street Global Advisors

For four decades, State Street Global Advisors has served the world's governments, institutions and financial advisors. With a rigorous, risk-aware approach built on research, analysis and market-tested experience, we build from a breadth of active and index strategies to create cost-effective solutions. As stewards, we help portfolio companies see that what is fair for people and sustainable for the planet can deliver long-term performance. And, as pioneers in index, ETF, and ESG investing, we are always inventing new ways to invest. As a result, we have become the world's third-largest asset manager with US \$3.12 trillion* under our care.

* AUM reflects approximately \$43.72 billion USD (as of 31 December 2019), with respect to which State Street Global Advisors Funds Distributors, LLC (SSGA FD) serves as marketing agent; SSGA FD and State Street Global Advisors are affiliated.

Increase in real interest rates can cause the price of inflation-protected debt securities to decrease. Interest payments on inflation-protected debt securities can be unpredictable.

Currency Risk is a form of risk that arises from the change in price of one currency against another. Whenever investors or companies have assets or business operations across national borders, they face currency risk if their positions are not hedged.

Bonds generally present less short-term risk and volatility than stocks, but contain interest rate risk (as interest rates raise, bond prices usually fall); issuer default risk; issuer credit risk; liquidity risk; and inflation risk. These effects are usually pronounced for longer-term securities. Any fixed income security sold or redeemed prior to maturity may be subject to a substantial gain or loss.

The information contained in this communication is not a research recommendation or 'investment research' and is classified as a 'Marketing Communication' in accordance with the Markets in Financial Instruments Directive (2014/65/EU) or applicable Swiss Regulator. This means that this marketing communication (a) has not been prepared in accordance with legal requirements designed to promote the independence of investment research (b) is not subject to any prohibition on dealing ahead of the dissemination of investment research.

International Government bonds and corporate bonds generally have more moderate short-term price fluctuations than stocks, but provide lower potential long-term returns.

Investing in foreign domiciled securities may involve risk of capital loss from unfavourable fluctuation in currency values, withholding taxes, from differences in generally accepted accounting principles or from economic or political instability in other nations.

Investments in emerging or developing markets may be more volatile and less liquid than investing in developed markets and may involve exposure to economic structures that are generally less diverse and mature and to political systems which have less stability than those of more developed countries.

Diversification does not ensure a profit or guarantee against loss.

These investments may have difficulty in liquidating an investment position without taking a significant discount from current market value, which can be a significant problem with certain lightly traded securities.
